Interleukin-6 is a nonspecific marker associated with an inflammatory response and is not diagnostic for any specific disease or disease process.

Patient samples may contain heterophilic antibodies or mouse monoclonal antibodies that could react in immunoassays to give a falsely elevated or depressed result.

Patients receiving Biotin therapy in high doses should not be tested for atleast 8 hours after last dose

Results should always be interpreted in conjunction with patient's medical history, clinical presentation and other findings.

Test conducted in EDTA plasma.
